                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; Sw:, SWISSPROT; Tr., TREMBL; Wp:, WORMPEP; Information on the WORMPEP better of the property of the subclone and the surface of the surfa

It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GGTGCTCCAGCTGCCTGCAGGCAACAGTCCAGGAGGTGCAGCCCCGG 698

                                                                                                                                                                                                                                         Submitted (09-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, X77030, USA
On Nov 9, 2002 this sequence version replaced gi:23264551.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (19-FEB-2002) Human Genome Sequencing of Molecular and Human Genetics, Baylor College Baylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 232984)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 (bases 1 to 232984) Worley, K.C.
                                    shotgun sequence table.
                                                                         may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Direct Submission

NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft_data.html).

NOTE: This is a "working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            as soon as it is available and the accession number will be preserved.

On Apr 5, 2004 this sequence version replaced gi:45433987.
together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           87;

The AIR polypeptides and polynucleotides can be used in methods for the diagnosis and treatment of diseases related to immune maturation and regulation of immune response towards self and nonself. They can be use particularly in the diagnosis and treatment of autoimmune polygendocrinopathy candidasis ectodermal dystrophy (APECED) (also know as autoimmune polyglandular syndrome type I (APS I))
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1545 BP; 261 A; 485 C; 508 G; 291 T; 0 U; 0 Other;

The AIR polypeptides and polynucleotides can be used in methods for the diagnosis and treatment of diseases related to immune maturation and regulation of immune response towards self and nonself. They can be use particularly in the diagnosis and treatment of autoimmune polyendocrinopathy candidiasis ectodermal dystrophy (APECED) (also know as autoimmune polyglandular syndrome type I (APS I))
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-APR-1999

The AIR polypeptides and polynucleotides can be used in methods for the diagnosis and treatment of diseases related to immune maturation and regulation of immune response towards self and nonself. They can be used particularly in the diagnosis and treatment of autoimmune polypendocrinopathy candidiasis ectodermal dystrophy (APECED) (also known as autoimmune polyglandular syndrome type I (APS I))
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 2036 BP; 359 A; 718 C; 649 G; 310 T; 0 U; 0 Other;

Claim 1; Fig 2A; 77pp; English New polypeptide which co-segregates ä mutated

CC This is the nucleotide sequence of human autoimmune polyglandular disease CC type 1 (APGD1 or AIRE) CDNA. It is a composite of 2 clones, which were CC obtained from a human adult thymus CDNA library by PCR (see AAV5609-10), CCC and of a 3'UTR extension PCR product. The encoded protein (see AAV56073) CC is a transcription factor or transcription- associated factor that may associate with vimentin fibres, perhaps as part of a docking mechanism CC prevent formation of vimentin intermediate filaments. Mutated APGD1 CC polypeptides co-segregate with autoimmune polyendocrinopathy candidiasis CC ecidermal dystrophy (APECED). The invention provides vectors and host CC cells for preparation of APGD1 polypeptides. APECED-associated mutations CC found in the APGD1 gene include: an insertion of 4 nucleotides (CCTG), normally found at position 1086-1089, at nucleotides (CCTG), an insertion of an adenosine at position of nucleotides 1095-1097; a cytosine at position 1369; a deletion of nucleotides 1095-1097; a cytosine at position 1309 or 1313; a cytosine to thymidine exchange at position 358; an adenosine to thymidine exchange at position 358; an adenosine exchange at position 1052; and a cytosine to adenosine to adenosine exchange at position 1052; and a cytosine to adenosine exchange to position 1094. A CC position 1052; and a cytosine to adenosine exchange to position 1094. A CC position 1052; and a cytosine to adenosine exchange to position 1094. A CC position to thymidine exchange to position 1094. A CC position 1052; and a cytosine to adenosine exchange to position 1094. A CC position 4 polypeptide. APGD1 nucleic acid can be used in gene CC position 4 polypeptide. APGD1 nucleic acid can be used in gene therapy

```

This is the nucleotide sequence of murine AIRE cDNA. Murine AIRE is the homologue of the human AIRE (or autoimmune polyglandular disease type 1, APGDI) gene (see AAX58605). The overall nucleotide sequence identity between the mouse AIRE coding sequence and that of the human is 76.67%. The mAIRE gene was localised to chromosome 10. Human mutated APGDI cosegregates with autoimmune polyendocrinopathy candidiasis ectodermal dystrophy (APECED). The murine homologue may be used to develop an animal model for APECED, to examine the events that lead to the development of APECED and possibly to develop agents for preventing and/or treating this autoimmune disease

                                                                                                                                                                                                                                         The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
The invention relates to human chromodomain, helicase, DNA-binding 5 CC (CHD5; ADH12180) and cDNA encoding it (ADH12179). CHD5 is a novel member of the CHD gene family, members of which have a profound effect on cof the CHD gene family, members of which have a profound effect on the choice in cell cycle control, regulation of development, and conceptness (CHD5 comprises two N-terminal zinc finger domains of the PHD CC (plant homeodomain) class, two chromodomains, a central region which CC contains a predicted DEAH-box-type helicase domain and a putative SNF2 CC domain, and several nuclear localisation signals. The gene encoding CHD5 is located on chromosome 1p36.3, a region frequently deleted in a variety of cancers including neuroblastoma, and the protein is preferentially CC expressed in brain. CHD5 is therefore thought to be a modulator of normal neural development and neoplasias of neural tissue origin. The invention CC also relates to vectors and host cells comprising the CHD5 cDNA sequence, an antibody against CHD5, a method of screening for modulators of CHD5 activity; a method of diagnosing cancer in a patient, where a reduced CC level or absence of CHD5 or CHD5 nucleic acids indicates the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; chromodomain helicase DNA-binding 5; CHD5; chromosome 1p36.3; chromatin structure; chromatin unwinding; DNA repair; DNA recombination; transacriptional regulation; gene expression; cell cycle control; development regulation; oncogenesis; brain; neural development; neural tissue neoplasia; diagnosis; cancer; neural cancer; neuroblastoma; breast cancer; colon cancer; liver tumour; germ cell tumour;
                                                                                                                                                                                                                                                                                                                                                    Claim

The methods of the invention are useful in the diagnosis or treatment of cancers such as neural cancers (e.g., neuroblastoma), breast cancer, colon cancer, liver tumours and germ cell tumours. The CHD5 protein, CHD5 nucleic acids and anti-CHD5 antibodies are useful as research tools to identify other proteins that are intimately involved in chromatin unwinding, DNA repair and recombination, and transcriptional
                                                                                                                                                                                                                                                                                                                            New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit genome, useful for detecting tissue-, pathology-, and developmental-
